*"WIP is a powerful boost for every
(Qlik) BI Team."*

~ Soares Flávio ~

Easy Administration with WIP

WIP is a powerful boost for every (Qlik) BI Team. It produces a safer development and deployment environment and it gives the team full control on each member's work. The seamless interaction and integration with Qlik is a strong component for maintainable and well-structured BI projects.

Challenges

Informatec provides an exclusive solution in the DACH Region for tidy and professional version management and deployment with WIP for Qlik. For most companies we are working with, the development of QlikView and Qlik Sense applications for the BI-team is often challenging; Different versions are in circulation or individual software adaptations have not been adopted across the board.

Solutions

WIP enables optimal control of the administration and distribution of Qlik versions within a business intelligence (BI). This fact reduces the administrative burden of Qlik applications to a minimum. WIP automatically creates versions with unique naming conventions and allows us to compare them. WIP also manages and controls all aspects of a file throughout its life cycle, from its requirement to retirement.

Results / Benefits

Developers and system administrators obtain a secure tool for effective management of development and deployment in QlikView or Qlik Sense for one or more environments within the enterprise. This minimizes the risks potentially created by various versions being used in parallel or incorrect user definitions. Fully automated version control and check-out / check-in functions, source control with compare function between applications and display of the deployment process over multiple environments are further benefits of WIP.

We have a strong partnership with ebiexperts; we appreciate that they share their knowledge and that they are also aware of our input for further development.

**50% INCREASED
Quality Control**
due to automated checks and controlled deployments

**80% RISK
REDUCTION**
due to versioning and roll-back functionalities

**50% DevOps
Efficiency**
due to an efficient team workflow
